

METHODS AND APPARATUS TO FACILITATE
ORTHODONTIC ALIGNMENT OF TEETH

ABSTRACT OF THE DISCLOSURE

An apparatus facilitates treatment of a tooth that is at least partially impacted. The apparatus includes a wire including a first end, a second end, and a substantially planar body extending therebetween. The first end is configured to couple to a tooth. The second end is configured to secure the apparatus relative to the tooth such that the wire applies a substantially continuous force to the tooth.
